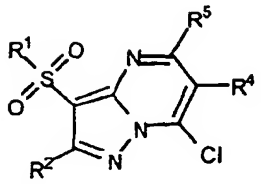
[0016] The manufacture of the novel compounds can be effected in a manner known per se; that of formula I-A is described in Examples 1-119 and that of formula I-B is described in Examples 120-125. Moreover, Schemes 1-3 provide a general overview with respect to the possibilities available for the preparation of these novel compounds, with the starting compounds of formula III in Scheme 1 being known from the literature or being preparable in analogy to described methods.

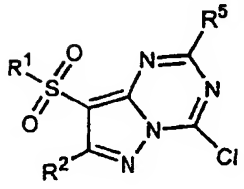
[0017] The compounds of formulae I-A and I-B also embrace those compounds in which hydrogen can be replaced by tritium.

[0018] The compounds of formulae I-A and I-B can be manufactured by reacting a compound of the formula



X

or a compound of the formula



XIV

with a compound of the formula

HR^3

wherein R^1-R^5 have the significances described above, and optionally converting a compound of general formula I-A or I-B into a pharmaceutically acceptable salt.

[0019] The reaction of a compound of formulae X or XIV with a compound of the formula HR^3 is effected according to methods known per se. Conveniently, a compound of formulae X or XIV is dissolved in DMF and depending on the reaction partner, which can be dissolved in DMF or an alcohol, reacted at room temperature or at the boiling temperature of the solvent used. Especially preferred reaction partners for the compounds of formulae X or XIV are piperazine, 1-methyl-piperazine, NH_3, methylamine, dimethylamine, morpholine, imidazole, N-benzylpiperidine, 1-(2-hydroxyethyl)-piperazine, 1-phenylpiperazine, 2-dimethylaminoethylamine or cis-2,6-dimethylpiperazine.

[0020] The compounds of formulae I-A and I-B can subsequently converted into pharmaceutically acceptable salts. Not only salts with inorganic acids, but also salts with organic acids come into consideration. Examples from the large number of such salts are hydrochlorides, hydrobromides, sulphates, nitrates, citrates, acetates, maleates, succinates, methanesulphonates, p-toluenesulphonates and the like. These salts can be manufactured according to methods which are known per se and which will be familiar to any person skilled in the art.

[0023] As mentioned earlier, the compounds of formulae I-A and I-B are novel. They have pharmacological properties and possess only a low toxicity. They have as a common feature they pronounced affinity to 5-HT_6 receptors and, on the basis of their action at this receptor, are suitable for the treatment or prevention of central nervous disorders such as, for example, psychoses, schizophrenia, manic depressions, neurological disorders, memory disorders, Parkinson's disease, amyotrophic lateral sclerosis, Alzheimer's disease and Huntington's chorea.

[0024] The binding of the compounds of formulae I-A and I-B in accordance with the invention to 5-HT_6 receptors was determined as follows.

[0025] Membranes obtained from HEK 1293 cells which had been transfected with 5-HT_6 receptors from rats were used.

[0026] The cells were purified by two-fold centrifugation (10 minutes at 3000 g) in phosphate buffer-sodium chloride solution. The cell mass was suspended in an ice-cold solution consisting of 50 mm Tris-HCl buffer, 10 mm $MgCl_2$, 0.5 mm EDTA and 0.1 mm phenylmethylsulphonyl fluoride and homogenized (Polytron homogenizer, 15 seconds at maximum speed). The homogenizate was incubated at 37°C for 10 minutes and subsequently centrifuged (20 minutes at 20 000 g). The cell mass was again suspended in the aforementioned Tris buffer solution. The cell concentration obtained was 4 x 10^7 cells/ml. 1 ml aliquots of the homogenizate were frozen at -80°C.

[0027] Displacement experiments were carried out in order to determine the affinity of the test substance to the 5-HT_6 receptor. For the performance of the test, the homogenizate was thawed and suspended in a buffer solution (pH 7.4) consisting of 50 mm Tris-HCl buffer, 5 mm $MgCl_2$, 10^{-5} M pargyline and 0.1% ascorbic acid. 100 µl of membrane

suspension, 50 µl of [^{3}H]-LSD (specific activity 85Ci/mMol, final concentration 1 NM) and 50 µl of test substance solution were incubated at 37°C for 1 hour. The respective test substance was investigated at 7 different concentrations of 10^{-10} M to 10^{-4} M. The binding reaction of the test substance was interrupted by rapid filtration through a Whatmann GF/B filter. The filters were washed with 2 x 2 ml of Tris-HCl buffer (50 mm pH 7.4) and the radioactivity of the filter was measured by scintillation spectroscopy in 2 ml of scintillation solution. All tests were carried out in triplicate and repeated three times. The pKi values ($pKi = -\log_{10}Ki$) of the test substances have been determined. The Ki value is defined by the following formula

$$Ki = \frac{IC_{50}}{1 + \frac{[L]}{K_D}}$$

in which the IC_{50} values are those concentrations of the test compounds in NM by which 50% of the ligands bonded to the receptor are displaced. [L] is the concentration of the ligand and the K_D value is the dissociation constant of the ligand.

[0028] The compounds in accordance with the invention have a selective affinity to 5-HT 6 receptors with a pKi value between 6.5 and 9.5.

[0029] The compounds of formulae I-A and I-B and the pharmaceutically acceptable salts of the compounds of formulae I-A and I-B can be used as medicaments, e.g. in the form of pharmaceutical preparations. The pharmaceutical preparations can be administered orally e.g. in the form of tablets, coated tablets, dragées, hard and soft gelatine capsules, solutions, emulsions or suspensions. However, the administration can also be effected rectally, e.g. in the form of suppositories, or parentally, e.g. in the form of injection solutions.

[0030] For the production of pharmaceutical preparations, the compounds of formulae I-A and I-B and the pharmaceutically acceptable salts of the compounds of formulae I-A and I-B can be processed with pharmaceutically inert, inorganic or organic carriers. Lactose, corn starch or derivatives thereof, talc, stearic acid or its salts and the like can be used as such carriers for tablets, coated tablets, dragées and hard gelatine capsules. Suitable carriers for soft gelatine capsules are, for example, vegetable oils, waxes, fats, semi-solid and liquid polyols and the like. Depending on the nature of the active ingredient no carriers are, however, usually required in the case of soft gelatine capsules. Suitable carriers for the production of solutions and syrups are, for example, water, polyols, glycerol, vegetable oils and the like. Suitable carriers for suppositories are, for example, natural or hardened oils, waxes, fats, semi-liquid or liquid polyols and the like.

[0031] Moreover, the pharmaceutical preparations can contain preservatives, solubilizers, stabilizers, wetting agents, emulsifiers, sweeteners, colorants, flavorants, salts for varying the osmotic pressure, buffers, masking agents or antioxidants. They can also contain still other pharmaceutically valuable substances.

[0032] Medicaments containing a compound of formula I-A or I-B or a pharmaceutically acceptable salt thereof and a therapeutically inert carrier are also an object of the present invention, as is a process for their production, which comprises bringing one or more compounds of formula I and/or pharmaceutically acceptable acid addition salts thereof and, if desired, one or more other therapeutically valuable substances together with one or more therapeutically inert carriers into a galenical administration form in a manner known per se.

[0033] In accordance with the invention compounds of general formulae I-A and I-B as well as their pharmaceutically acceptable salts can be used in the treatment or prevention of central nervous disorders, such as depressions, psychoses, schizophrenia, neurological disorders, memory disorders, Parkinson's disease, amyotrophic lateral sclerosis, Alzheimer's disease, Huntington's chorea and for the production of corresponding medicaments. The dosage can vary within wide limits and will, of course, be fitted to the individual requirements in each particular case. In the case of oral administration the dosage lies in a range of about 0.1 mg per dose to about 1000 mg per day of a compound of general formula I-A or I-B or the corresponding amount of a pharmaceutically acceptable salt thereof, although the upper limit can also be exceeded when this is shown to be indicated.

[0034] The following Examples serve to illustrate the present invention in more detail. However, they are not intended to limit its scope in any manner.
